## SCALA CHEATSHEET

# SCALACHEAT

Thanks to [Brendan O'Connor](#), this cheatsheet aims to be a quick reference of Scala syntactic constructions. Licensed by Brendan O'Connor under a CC-BY-SA 3.0 license.

### variables

```
var x = 5
```

variable

**GOOD**

```
val x = 5
```

constant

**BAD**

```
x=6
```

```
var x: Double = 5
```

explicit type

**GOOD**

```
def f(x: Int) = { x*x }
```

**BAD**

```
def f(x: Int) { x*x }
```

define function  
hidden error:  
without = it's a  
Unit-returning  
procedure; causes  
havoc

**GOOD**

```
def f(x: Any) = println(x)
```

**BAD**

```
def f(x) = println(x)
```

define function  
syntax error: need  
types for every  
arg.

```
type R = Double
```

type alias

```
def f(x: R) vs.
```

```
def f(x: => R)
```

call-by-value  
call-by-name (lazy  
parameters)

```
(x:R) => x*x
```

anonymous  
function

```
(1 to 5).map(_*2) vs.
```

```
(1 to 5).reduceLeft( _+_ )
```

anonymous  
function:  
underscore is  
positionally  
matched arg.

```
(1 to 5).map( x => x*x )
```

anonymous  
function: to use an  
arg twice, have to  
name it.

**GOOD**

```
(1 to 5).map(2*)
```

**BAD**

anonymous  
function: bound  
infix method. Use

<code>(1 to 5).map { x =&gt; val y=x*2; println(y); y }</code>	anonymous function: block style returns last expression.
<code>(1 to 5) filter {_%2 == 0} map {_*2}</code>	anonymous functions: pipeline style. (or parens too).
<code>def compose(g:R=&gt;R, h:R=&gt;R) = (x:R) =&gt; g(h(x)) val f = compose({_*2}, {_-1})</code>	anonymous functions: to pass in multiple blocks, need outer parens.
<code>val zscore = (mean:R, sd:R) =&gt; (x:R) =&gt; (x- mean)/sd</code>	currying, obvious syntax.
<code>def zscore(mean:R, sd:R) = (x:R) =&gt; (x- mean)/sd</code>	currying, obvious syntax
<code>def zscore(mean:R, sd:R)(x:R) = (x-mean)/sd</code>	currying, sugar syntax. but then:
<code>val normer = zscore(7, 0.4) _</code>	need trailing underscore to get the partial, only for the sugar version.
<code>def mapmake[T](g:T=&gt;T)(seq: List[T]) = seq.map(g)</code>	generic type.
<code>5.+(3); 5 + 3 (1 to 5) map {_*2}</code>	infix sugar.

## packages

<code>import scala.collection._</code>	wildcard import.
<code>import scala.collection.Vector</code> <code>import scala.collection.{Vector, Sequence}</code>	selective import.
<code>import scala.collection.{Vector =&gt; Vec28}</code>	renaming import.
<code>import java.util.{Date =&gt; _, _}</code>	import all from java.util except Date.
<code>package pkg</code> <i>at start of file</i> <code>package pkg { ... }</code>	declare a package.

## data structures

<code>(1,2,3)</code>	tuple literal. ( <code>Tuple3</code> )
<code>var (x,y,z) = (1,2,3)</code>	destructuring bind: tuple unpacking via pattern matching.
<b>BAD</b> <code>var x,y,z = (1,2,3)</code>	hidden error: each assigned to the entire tuple.
<code>var xs = List(1,2,3)</code>	list (immutable).
<code>xs(2)</code>	paren indexing. ( <a href="#">slides</a> )
<code>1 :: List(2,3)</code>	cons.

<code>()</code> ( <i>empty parens</i> )	sole member of the Unit type (like C/Java void).
---	--

## control constructs

<code>if (check) happy else sad</code>	conditional.
<code>if (check) happy</code> <i>same as</i> <code>if (check) happy else ()</code>	conditional sugar.
<code>while (x &lt; 5) { println(x); x += 1 }</code>	while loop.
<code>do { println(x); x += 1 } while (x &lt; 5)</code>	do while loop.
<code>import scala.util.control.Breaks._</code> <code>breakable {</code> <code>for (x &lt;- xs) {</code> <code>if (Math.random &lt; 0.1)</code> <code>break</code> <code>}</code> <code>}</code>	break. ( <a href="#">slides</a> )
<code>for (x &lt;- xs if x%2 == 0) yield x*10</code> <i>same as</i> <code>xs.filter(_%2 == 0).map(_*10)</code>	for comprehension: filter/map
<code>for ((x,y) &lt;- xs zip ys) yield x*y</code> <i>same as</i> <code>(xs zip ys) map { case (x,y) =&gt; x*y }</code>	for comprehension: destructuring bind
<code>for (x &lt;- xs; y &lt;- ys) yield x*y</code> <i>same as</i> <code>xs flatMap {x =&gt; ys map {y =&gt; x*y}}</code>	for comprehension: cross product

}

[sprintf-style](#)

```
for (i <- 1 to 5) {
  println(i)
}
```

for  
comprehension:  
iterate including  
the upper bound

```
for (i <- 1 until 5) {
  println(i)
}
```

for  
comprehension:  
iterate omitting  
the upper bound

## pattern matching

**GOOD**

```
(xs zip ys) map { case (x,y) => x*y }
```

**BAD**

```
(xs zip ys) map( (x,y) => x*y )
```

use case in  
function args for  
pattern matching.

**BAD**

```
val v42 = 42
Some(3) match {
  case Some(v42) => println("42")
  case _ => println("Not 42")
}
```

"v42" is  
interpreted as a  
name matching  
any Int value, and  
"42" is printed.

**GOOD**

```
val v42 = 42
Some(3) match {
  case Some(`v42`) => println("42")
  case _ => println("Not 42")
}
```

"`v42`" with  
backticks is  
interpreted as the  
existing val v42,  
and "Not 42" is  
printed.

**GOOD**

UppercaseVal is

```
val UppercaseVal = 42
Some(3) match {
  case Some(UppercaseVal) => println("42")
  case _ => println("Not 42")
}
```

pattern variable, because it starts with an uppercase letter. Thus, the value contained within UppercaseVal is checked against 3, and "Not 42" is printed.

## object orientation

```
class C(x: R)
```

constructor  
params - x is only available in class body

```
class C(val x: R)
var c = new C(4)
c.x
```

constructor  
params -  
automatic public member defined

```
class C(var x: R) {
  assert(x > 0, "positive please")
  var y = x
  val readonly = 5
  private var secret = 1
  def this = this(42)
}
```

constructor is  
class body  
declare a public member  
declare a gettable but not settable member  
declare a private member  
alternative

<code>abstract class D { ... }</code>	define an abstract class. (non-createable)
<code>class C extends D { ... }</code>	define an inherited class.
<code>class D(var x: R)</code> <code>class C(x: R) extends D(x)</code>	inheritance and constructor params. (wishlist: automatically pass-up params by default)
<code>object O extends D { ... }</code>	define a singleton. (module-like)
<code>trait T { ... }</code> <code>class C extends T { ... }</code> <code>class C extends D with T { ... }</code>	traits. interfaces-with-implementation. no constructor params. <a href="#">mixin-able</a> .
<code>trait T1; trait T2</code> <code>class C extends T1 with T2</code> <code>class C extends D with T1 with T2</code>	multiple traits.
<code>class C extends D { override def f = ... }</code>	must declare method overrides.
<code>new java.io.File("f")</code>	create object.
<b>BAD</b> <code>new List[Int]</code>	type error: abstract type instead,

	type
<code>classOf[String]</code>	class literal.
<code>x.isInstanceOf[String]</code>	type check (runtime)
<code>x.asInstanceOf[String]</code>	type cast (runtime)
<code>x: String</code>	ascription (compile time)
